RVNR-01

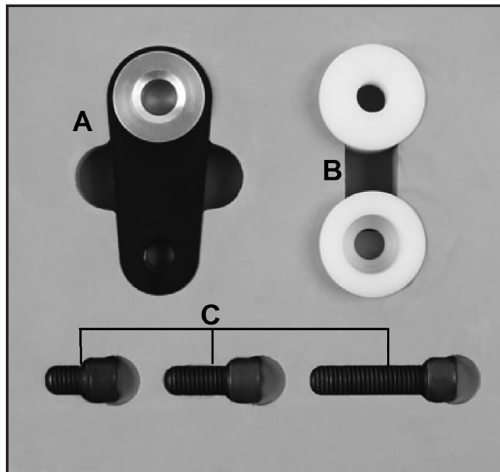

Specifications

Designed to allow the drive flange to be locked and prevent rotation when loosening or tightening inner drive shaft mounting bolts and hub nuts.

Easily fitted utilising the vehicles own wheel bolt or nut ensuring the specially designed plastic wheel wedges between the brake caliper and drive flange.

- Drive flange hub locking device.
- Used to lock car drive flanges and drive shafts allowing the removal of driveshaft and hub fixings.
- One man operation - no need for an assistant to hold the flange.
- Easy to use and reposition for multiple bolt removal (inner drive shaft bolts).
- Durable plastic wheels prevent damage to brake components or hub.

Components

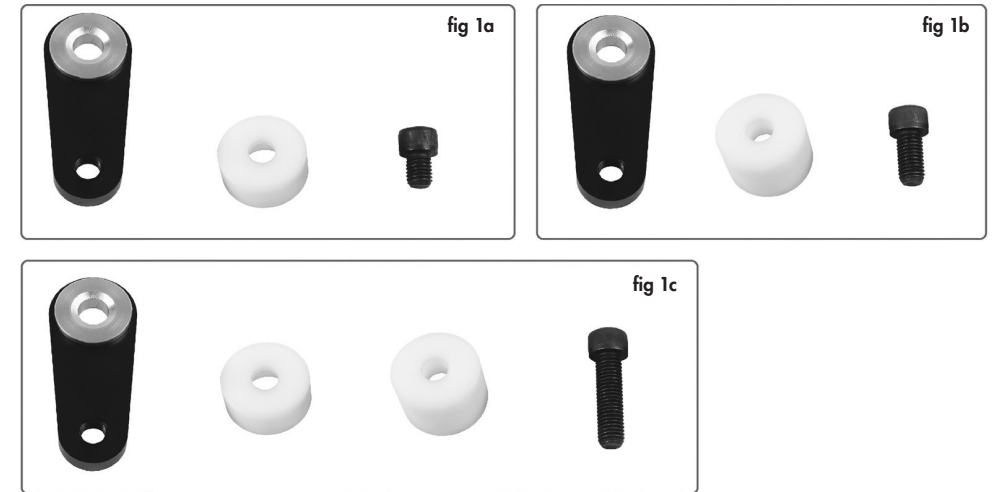

Reference	Description
A	Mounting Arm
B	Wheel Wedges
C	Mounting Bolts for B

Instructions

Components A/B/C

Assemble the component A/B/C as shown.

When fitted to the vehicle, the plastic wheel wedge should jam against the brake caliper to prevent the drive flange from turning. See fig 1a, 1b & 1c.

Fit the assembly as shown in fig 2 below.
